## Solutions to Problem Set 4

1. (a) heat engine

Develop the equations you need:

| Equation | Basis for the equation | Eq. <br> $\#$ |
| :--- | :--- | :--- |
| $\varepsilon=-W_{\text {cycle }} / \mathrm{q}_{\mathrm{h}}$ | Efficiency of any heat engine based on 2 thermal <br> reservoirs is the ratio of the work produced in the <br> surroundings to the quantity of heat transferred from <br> the high temperature reservoir | 1 |
| $-\mathrm{W}_{\text {cycle }}=\mathrm{R}\left(\mathrm{T}_{\mathrm{h}}-\mathrm{T}_{\mathrm{c}}\right) \ln \left(\mathrm{V}_{\mathrm{B}} / \mathrm{V}_{\mathrm{A}}\right)$ <br> $\mathrm{q}_{\mathrm{h}}=R \mathrm{~T}_{\mathrm{h}} \ln \left(\mathrm{V}_{\mathrm{B}} / \mathrm{V}_{\mathrm{A}}\right)$ <br> $\varepsilon$ rev cycle $=\left(\mathrm{T}_{\mathrm{h}}-\mathrm{T}_{\mathrm{c}}\right) / \mathrm{T}_{\mathrm{h}}$ | For the Carnot cycle operating reversibly using an <br> ideal gas (see lecture notes Part 3) <br> efficiency is given by this equation. | 2 |
| $\varepsilon$ rev cycle $=\varepsilon$ rev cycle' | For all engines based on 2 thermal reservoirs and <br> operating reversibly using any gas, efficiency is the <br> same. (See lecture notes Part 3.) This is the <br> maximum possible efficiency. | 3 |
| $\left(T_{h}-T_{c}\right) / T_{h}=(125-25) /(125+273)$ <br> $=0.251$ | Given $t_{c}$ and th are 25 deg and 125 deg respectively | 4 |
| $\varepsilon$ rev cycle $=0.251$ Answer | Maximum possible efficiency for this problem | 5 |

Maximum possible efficiency of heat engine is for ideal, reversible conditions, i.e., no frictional loss.
(b) Given $T_{c}$ and $T_{h}$ are 4 K and 20 K respectively, efficiency of a reversible engine working between heat reservoirs at these temperatures is $\left(T_{h}-T_{c}\right) / T_{h}=(20-4) /(20)=0.80$
(c) Given efficiency $=0.80$ and $T_{c}=300 \mathrm{~K},\left(T_{h}-300\right) / T_{h}=0.80$, therefore $T_{h}=1500 \mathrm{~K}$
2. Refrigerator:

Develop the equations you need:

| Equation | Basis for the equation | Eq. <br> \# |
| :---: | :---: | :---: |
| $\beta=q_{c} / W_{\text {cycle }}$ | Definition of coefficient of performance of a refrigerator | 1 |
| $\mathrm{dU}=\delta \mathrm{q}+\delta \mathrm{W}$ | First Law of Thermodynamics | 2 |
| For a cycle: $\Delta \mathbf{U}=0$ | $\mathbf{U}$ is a state function | 3 |
| $\begin{aligned} & 0=q_{\text {cycle }}+W_{\text {cycle }} \\ & 0=q_{c}+q_{h}+W_{\text {cycle }} \\ & W_{\text {cycle }}=-q_{c}-q_{h} \end{aligned}$ | From Eq 2 and 3 | 4 |
| $\begin{aligned} & -W_{\text {cycle }}=R\left(T_{h}-T_{c}\right) \ln \left(V_{B} / V_{A}\right) \\ & q_{c}=-R T_{c} \ln \left(V_{B} / V_{A}\right) \\ & W_{\text {cycle }}=R\left(T_{h}-T_{c}\right) \ln \left(V_{B} / V_{A}\right) \\ & q_{c}=R T_{c} \ln \left(V_{B} / V_{A}\right) \end{aligned}$ | For the Carnot cycle operating reversibly using an ideal gas (see lecture notes Part 3, <br> but change signs for reverse direction of cycle) | 5 6 |
| $\beta$ rev cycle $=T_{c} /\left(T_{h}-T_{c}\right)$ | From Eq. 1 and 6 ideal coeff of performance is given by this equation. | 7 |
| $\begin{aligned} & \mathrm{q}_{\mathrm{c}} / \mathrm{W}_{\text {cycle }}=(0.75) \bullet\left[\mathrm{T}_{\mathrm{c}} /\left(\mathrm{T}_{\mathrm{h}}-\mathrm{T}_{\mathrm{c}}\right)\right] \\ & \mathrm{q}_{\mathrm{c}}=\mathrm{W}_{\text {cycle }} \bullet(0.75) \bullet\left[\mathrm{T}_{\mathrm{c}} /\left(\mathrm{T}_{\mathrm{h}}-\mathrm{T}_{\mathrm{c}}\right)\right] \end{aligned}$ | Given: not ideal, actual is 75\% of ideal | 8 |
| $\mathrm{W}_{\text {cycle }}=(1 / 4)(10.688 \mathrm{kcal} / \mathrm{min})$ | Given, for 1 min | 9 |
| $\mathrm{T}_{\mathrm{c}}=-20+273, \mathrm{~T}_{\mathrm{h}}=35+273$ | Given: $t_{c}$ and $t_{h}$ are -20 deg and 35 deg respectively | 10 |
| $\begin{aligned} & \mathrm{q}_{\mathrm{c}}=(1 / 4)(10.688 \mathrm{kcal} / \mathrm{min}) \bullet(0.75) \\ & \bullet[253 /(308-253)] \end{aligned}$ | From Eq 8, 9,10 | 11 |
| $\mathrm{q}_{\mathrm{c}}=6.9138 \mathrm{kcal} / \mathrm{min}$ Answer | Solving Eq 10 | 12 |

The heat removed from the low temperature reservoir, if motor runs continuously, is $6.9138 \mathrm{kcal} / \mathrm{min}$. Therefore, can tolerate a maximum heat leak into the box by an amount $6.9138 \mathrm{kcal} / \mathrm{min}$.
3. 1 mole

(a)

| Equation | Basis for the equation | Eq. \\| |
| :---: | :---: | :---: |
| $\mathrm{d} \mathbf{U}=\delta \mathrm{q}+\delta \mathrm{W}$ | First Law of Thermodynamics | 1 |
| $\Delta \mathbf{U}_{1}=0$ | For an ideal gas, $\mathbf{U}=\mathbf{U}(\mathrm{T})$ only | 2 |
| $\begin{aligned} & \delta W=-p_{o p} d V \\ & p_{o p}=0 \\ & \delta W_{1}=0 \end{aligned}$ | Definition of pV work Given | 3 <br> 4 |
| $\delta q_{1}=0 ; q_{1}=0$ | From Eq 1, 2 and 4 | 5 |
| $\int \delta q_{1} / T=0$ | From Eq 5 | 6 |
| $\begin{aligned} & p_{\text {op }}=p_{\text {gas }} \\ & p_{\text {gas }}=(1) R T / V \\ & \delta W_{2}=-R T d V / V \end{aligned}$ | Step 2 is reversible ideal gas equation of state, 1 mole | $\begin{array}{\|l} \hline 7 \\ 8 \\ 9 \\ \hline \end{array}$ |
| $\delta \mathrm{q}_{2}=\mathrm{RTdV} / \mathrm{V}$ | From Eq 1 and 9 | 10 |
| $\int \delta \mathrm{q}_{2} / \mathrm{T}=\int \mathrm{RdV} / \mathrm{V}=\mathrm{R} \ln \left(\mathrm{V}_{1} / 2 \mathrm{~V}_{1}\right)$ | From Eq 10 | 11 |
| $\int \delta q_{2} / \mathrm{T}=-\mathrm{R} \ln (2)$ | Evaluating Eq 11 | 12 |
| $\begin{aligned} \int_{\text {cycle }} \delta \mathrm{q} / \mathrm{T} & =\int \delta q_{1} / \mathrm{T}+\int \delta \mathrm{q}_{2} / \mathrm{T} \\ & =-\mathrm{R} \ln (2) \end{aligned}$ | From Eq 5 and 12 | 13 |
| $\oint^{\lambda q_{\text {irrev }} / T}<0$ | As it should be, according to Clausius inequality. | 14 |

(b)

| Equation | Basis for the equation | Eq. <br> $\#$ |
| :--- | :--- | :--- |
| $\Delta \mathbf{S}=\int \delta \mathrm{q}_{\mathrm{REv}} / \mathrm{T}$ | Second Law of Thermodynamics | 15 |
| $\Delta \mathbf{S}_{2}=\int \delta \mathrm{q}_{2} / \mathrm{T}=-\mathrm{Rln}(2)$ <br> $=-\left(1 \mathrm{~mol}^{2}\right) 8.314 \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}(0.693)$ <br> $=-5.76 \mathrm{~J} \mathrm{~K}^{-1} \quad$ Answer | Step 2 is reversible and Eq 12 | 16 |

(c)

| Equation | Basis for the equation | Eq. <br>  <br>  <br> $\mathbf{S}_{\text {cycle }}=0$ <br> $\Delta \mathbf{S}_{\text {cycle }}=\Delta \mathbf{S}_{1}+\Delta \mathbf{S}_{2}$ |
| :--- | :--- | :--- |
|  | S is a state function | 17 |

| $0=\Delta \mathbf{S}_{1}-5.76 \mathrm{~J} \mathrm{~K}^{-1}$ | Use Eq 16 | 19 |
| :--- | :--- | :--- |
| $\Delta \mathbf{S}_{1}=+5.76 \mathrm{~J} \mathrm{~K}^{-1} \quad$ Answer | Solving Eq 19 | 20 |

(d)

| Equation | Basis for the equation | Eq. <br> $\#$ |
| :--- | :--- | :--- |
| $\mathrm{q}_{1}=0, \quad \mathrm{q}_{1} / \mathrm{T}=0$ | From Eq 5 | 21 |
| $\Delta \mathbf{S}_{1}=+5.76 \mathrm{~J} \mathrm{~K}^{-1} \neq 0 \quad$ Answer | As it should be; <br> since step 1 is not reversible, $\Delta \mathbf{S}_{1} \neq \mathrm{q}_{1} / T$ | 21 |

4. Given $T_{1}=10 \mathrm{~K}, \mathrm{~T}_{2}=300 \mathrm{~K}$ for one mol of an ideal gas, $\mathrm{C}_{\mathrm{V}}=(3 / 2) \mathrm{R}$

| Equation | Basis for the equation | Eq. \# |
| :---: | :---: | :---: |
| (a) $\mathrm{dV}=0$ | Given | 1 |
| $\mathrm{d} \mathbf{S}=(\partial \mathbf{S} / \partial \mathrm{T})_{\mathrm{V}} \mathbf{d T}+(\partial \mathbf{S} / \partial \mathrm{V})_{\mathrm{T}} \mathrm{dV}$ | $\mathbf{S}=\mathbf{S}(\mathrm{T}, \mathrm{V})$ | 2 |
| $\begin{aligned} & (\partial \mathbf{S} / \partial \mathrm{T})_{\mathrm{V}}=\mathrm{C}_{\mathrm{V}} / \mathrm{T} \\ & (\partial \mathrm{~S} / \partial \mathrm{V})_{T}=(1 / T)\left\{p+(\partial \mathrm{U} / \partial \mathrm{V})_{T}\right\}=(\partial p / \partial T)_{V} \end{aligned}$ | Derived (see lecture notes Part 4) starting from $\mathrm{d} U=\Delta \mathrm{q}_{\mathrm{rev}}-p \mathrm{~d} V=T \mathrm{~d} S-p \mathrm{~d} V$ | $\begin{aligned} & 3 \\ & 4 \end{aligned}$ |
| $\begin{aligned} & \mathrm{dS}=\left(\mathrm{C}_{\mathrm{V}} / \mathrm{T}\right) \mathrm{dT} \\ & \Delta \mathbf{S}=\int(3 / 2) \mathrm{RdT} / \mathrm{T} \\ & \hline \end{aligned}$ | From Eq 1, 2 and 3 | 5 |
| $\Delta \mathbf{S}=\left(1 \mathrm{~mol}^{2}\right)(3 / 2)\left(8.314 \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}\right)$ <br> - $\operatorname{In}(300 / 10)=42.4 \mathrm{~J} \mathrm{~K}^{-1}$ Answer | Integrating Eq 5 | 6 |
| (b) $\mathrm{dp}=0$ | Given | 7 |
| $\mathrm{dS}=(\partial \mathbf{S} / \partial \mathrm{T})_{\mathrm{p}} \mathrm{dT}+(\partial \mathbf{S} / \partial \mathrm{p})_{T} \mathrm{dp}$ | S = S(T, p) | 8 |
| $\begin{aligned} & (\partial \mathbf{S} / \partial \mathrm{T})_{\mathrm{p}}=\mathrm{C}_{\mathrm{p}} / \mathrm{T} \\ & (\partial \mathbf{S} / \partial \mathrm{p})_{T} \stackrel{( }{=}-(\partial \mathrm{V} / \partial T)_{p} \end{aligned}$ | Derived (see lecture notes Part 4) starting from $\mathrm{d} \boldsymbol{U}=\grave{\mathrm{d}} \mathrm{q}_{\mathrm{rev}}-p \mathrm{~d} V=T \mathrm{~d} \boldsymbol{S}-p \mathrm{~d} V$ and use of cross derivatives | $\begin{array}{\|l\|} \hline 9 \\ 10 \end{array}$ |
| $\mathrm{C}_{\mathrm{p}}-\mathrm{C}_{\mathrm{V}}=\mathrm{R}$ | For an ideal gas | 11 |
| $\begin{aligned} & \mathrm{dS}=\left(\mathrm{C}_{\mathrm{p}} / \mathrm{T}\right) \mathrm{dT} \\ & \Delta \mathbf{S}=\int(5 / 2) \mathrm{RdT} / \mathrm{T} \end{aligned}$ | From Eq 7, 8 and 9 From Eq 11 and 12 | $\begin{aligned} & 12 \\ & 13 \end{aligned}$ |
| $\Delta \mathbf{S}=(1 \mathrm{~mol})(5 / 2)\left(8.314 \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}\right)$ <br> $\bullet \ln (300 / 10)=70.7 \mathrm{~J} \mathrm{~K}^{-1} \quad$ Answer | Integrating Eq 13 | 14 |
| (c) 3 moles | Given | 15 |
| $\Delta \mathbf{S}=$ multiplied by factor of 3 Answer | Substituting 3 mol for 1 mol in Eq 6 and 14 | 16 |

5. (a) Given 1 mol liquid water $T_{1}=0+273 \mathrm{~K}, \mathrm{~T}_{2}=100+273 \mathrm{~K}$, constant pressure, $\mathrm{C}_{\mathrm{p}}=$ $18.0 \mathrm{cal} \mathrm{deg}^{-1} \mathrm{~mol}^{-1}$.

| Equation | Basis for the equation | Eq. $\#$ $\#$ |
| :---: | :---: | :---: |
| dp $=0$ | Given | 1 |
| $\mathrm{d} \mathbf{S}=(\partial \mathbf{S} / \partial \mathrm{T})_{\mathrm{p}} \mathrm{dT}+(\partial \mathbf{S} / \partial \mathrm{p})_{\mathrm{T}} \mathrm{dp}$ | $\mathbf{S}=\mathbf{S}(\mathrm{T}, \mathrm{p})$ | 2 |
| $\begin{aligned} & (\partial \mathbf{S} / \partial \mathrm{T})_{\mathrm{p}}=\mathrm{C}_{\mathrm{p}} / \mathrm{T} \\ & (\partial \mathbf{S} / \partial \mathrm{p})_{T} \stackrel{ }{=}-(\partial \mathrm{V} / \partial \mathrm{T})_{p} \end{aligned}$ | Derived (see lecture notes Part 4) starting from $\mathrm{d} \boldsymbol{U}=\Delta \mathrm{q}_{\mathrm{rev}}-p \mathrm{~d} V=T \mathrm{~d} \boldsymbol{S}-p \mathrm{~d} V$ <br> and use of cross derivatives | $\begin{aligned} & 3 \\ & 4 \end{aligned}$ |
| $\mathrm{C}_{\mathrm{p}}=18.0 \mathrm{cal} \mathrm{deg}^{-1} \mathrm{~mol}^{-1}$. | Given | 5 |
| $\mathrm{dS}=\left(\mathrm{C}_{p} / \mathrm{T}\right) \mathrm{dT}$ | From Eq 1, 2 and 3 | 6 |
| $\begin{aligned} & \Delta \mathbf{S}=\left(1 \mathrm{~mol}^{\prime}\right)\left(18.0 \mathrm{cal} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}\right) \bullet \\ & \ln (373 / 273)=5.62 \mathrm{cal} \mathrm{~K}^{-1} \\ & \text { Answer } \end{aligned}$ | Integrating Eq 6 and using Eq 5 | 7 |

(b) ice $\left(0^{\circ} \mathrm{C}, 1 \mathrm{~atm}\right) \rightarrow$ steam $\left(100^{\circ} \mathrm{C}, 1 \mathrm{~atm}\right) . \quad \Delta \mathbf{S}=$ ?

Devise reversible steps which lead from same initial state to same final state, to calculate any state function change for the given process.

| ice $\left(0^{\circ} \mathrm{C}, 1 \mathrm{~atm}\right) \rightarrow$ liq water $\left(0^{\circ} \mathrm{C}, 1 \mathrm{~atm}\right)$ | step (1) | $\Delta \mathbf{S}_{1}$ |
| :--- | :--- | :--- |
| liq water $\left(0^{\circ} \mathrm{C}, 1 \mathrm{~atm}\right) \rightarrow$ liq water $\left(100^{\circ} \mathrm{C}, 1 \mathrm{~atm}\right)$ | step (2) | $\Delta \mathbf{S}_{2}$ |
| liq water $\left(100^{\circ} \mathrm{C}, 1 \mathrm{~atm}\right) \rightarrow$ steam $\left(100^{\circ} \mathrm{C}, 1 \mathrm{~atm}\right)$ | step (3) | $\Delta \mathbf{S}_{3}$ |

$\Delta \mathbf{S}=\Delta \mathbf{S}_{1}+\Delta \mathbf{S}_{2}+\Delta \mathbf{S}_{3}$

| Equation | Basis for the equation | Eq. $\#$ $\#$ |
| :---: | :---: | :---: |
| $\mathrm{dp}=0$ | Given | 1 |
| $\mathrm{d} \mathbf{S}=(\partial \mathbf{S} / \partial \mathrm{T})_{p} \mathrm{dT}+(\partial \mathbf{S} / \partial \mathrm{p})_{\mathrm{T}} \mathrm{dp}$ | $\mathbf{S}=\mathbf{S}(\mathrm{T}, \mathrm{p})$ | 2 |
| $\begin{aligned} & (\partial \mathbf{S} / \partial \mathrm{T})_{\mathrm{p}}=\mathrm{C}_{p} / \mathrm{T} \\ & (\partial \mathbf{S} / \partial p)_{T} \stackrel{ }{=}-(\partial \mathrm{V} / \partial T)_{p} \end{aligned}$ | Derived (see lecture notes Part 4) starting from $\mathrm{d} \boldsymbol{U}=\Delta \mathrm{q}_{\mathrm{rev}}-p \mathrm{~d} V=T \mathrm{~d} \boldsymbol{S}-p \mathrm{~d} V$ and use of cross derivatives | $\begin{aligned} & \hline 3 \\ & 4 \end{aligned}$ |
| $\mathrm{C}_{\mathrm{p}}=18.0 \mathrm{cal} \mathrm{deg}^{-1} \mathrm{~mol}^{-1}$. | Given | 5 |
| $\mathrm{q}_{\mathrm{p}}=1.4363 \mathrm{kcal} \mathrm{mol}^{-1}$ at ( $0^{\circ} \mathrm{C}, 1 \mathrm{~atm}$ ) | Given. This is $\mathrm{q}_{\text {REV, fusion }}$ at these conditions | 6 |
| $\mathrm{q}_{\mathrm{p}}=9.7171 \mathrm{kcal} \mathrm{mol}^{-1}$ at ( $100^{\circ} \mathrm{C}, 1 \mathrm{~atm}$ ) | Given. This is $\mathrm{q}_{\text {Rev, vaporizn }}$ at these conditions | 7 |
| $\mathrm{C}_{\mathrm{p}}=18.0 \mathrm{cal} \mathrm{deg}^{-1} \mathrm{~mol}^{-1}$. | Given | 8 |
| $\begin{aligned} & \mathrm{dS}=\left(\delta \mathrm{q}_{\mathrm{REV}} / \mathrm{T}\right) \\ & \Delta \mathbf{S}=\mathrm{q}_{\mathrm{REV}} / \mathrm{T} \text { for constant } \mathrm{T} \end{aligned}$ | Second Law of thermodynamics | $\begin{aligned} & 9 \\ & 10 \end{aligned}$ |
| $\begin{aligned} & \operatorname{step}(1): \\ & \Delta \mathbf{S}_{1}=\mathrm{q}_{\text {REV }} / \mathrm{T} \end{aligned}$ | Eq 10 and using Eq 6 | 11 |

| $\begin{aligned} & =\left(1 \mathrm{~mol}^{2}\left(1436.3 \mathrm{cal} \mathrm{~mol}^{-1}\right) / 273\right. \\ & \Delta \mathbf{S}_{1}=5.26 \mathrm{cal} \mathrm{~K}^{-1} \end{aligned}$ | Evaluating Eq 11 |  |
| :---: | :---: | :---: |
| $\begin{aligned} & \text { step (2): } \\ & \mathrm{dS}=\left(\mathrm{C}_{\mathrm{p}} / \mathrm{T}\right) \mathrm{dT} \\ & \Delta \mathbf{S}_{2}=(1 \mathrm{~mol})\left(18.0 \mathrm{cal} \mathrm{deg}^{-1} \mathrm{~mol}^{-1}\right) \bullet \\ & \ln (373 / 273)=5.62 \mathrm{cal} \mathrm{~K}^{-1} \end{aligned}$ | Eq 1, 2, 3 <br> Integrating Eq 12 and using Eq 8 Already done in part (a) of this problem | 12 13 |
| $\begin{aligned} & \text { step (3): } \\ & \mathbf{S}_{3}=\mathrm{q}_{\text {REV }} / \mathrm{T}=(1 \mathrm{~mol})(9717.1 \mathrm{cal} \\ & \left.\mathrm{mol}^{-1}\right) / 373 \\ & \Delta \mathbf{S}_{3}=26.05 \mathrm{cal} \mathrm{~K}^{-1} \end{aligned}$ | Eq 10 and using Eq 7 <br> Evaluating Eq 14 | 14 |
| $\begin{aligned} & \Delta \mathbf{S}=\Delta \mathbf{S}_{1}+\Delta \mathbf{S}_{2}+\Delta \mathbf{S}_{3} \\ & =5.26+5.62+26.05 \\ & =36.93 \text { cal K }^{-1} \quad \text { Answer } \end{aligned}$ | $\mathbf{S}$ is a state function | 15 |

6. (a) sulfur(s, rhombic) $\rightarrow$ sulfur(s, monoclinic)
(b) sulfur(s, monoclinic) $\rightarrow$ sulfur(liquid)
$\mathrm{T}_{\text {trans }}=95.4+273 \mathrm{~K}$,
q$_{\text {REV, trans }}=0.09 \mathrm{kcal} \mathrm{mol}^{-1} \Delta \mathbf{S}_{\mathrm{a}}=$ ?
$\mathrm{T}_{\text {trans }}=119+273 \mathrm{~K}$,
qrev, trans $=0.293 \mathrm{kcal} \mathrm{mol}^{-1} \Delta \mathbf{S}_{\mathrm{b}}=$ ?

| Equation | Basis for the equation | Eq. |
| :---: | :---: | :---: |
| $\mathrm{dp}=0$ | Given (understood, 1 atm ) | 1 |
| $\mathrm{q}_{\mathrm{p}}=\mathrm{q}_{\mathrm{REV}, \text { trans }}=0.09 \mathrm{kcal} \mathrm{mol}^{-1}$ at ( $95.4^{\circ} \mathrm{C}, 1 \mathrm{~atm}$ ) | Given. This is $\mathrm{q}_{\mathrm{REV} \text {, trans }}$ at these conditions, for 1 mol $=32 \mathrm{~g}$ | 2 |
| $\begin{aligned} & \mathrm{q}_{\mathrm{p}}=\mathrm{q}_{\mathrm{REv}, \text { fusion }}=0.293 \mathrm{kcal} \mathrm{~mol}^{-1} \\ & \text { at }\left(119^{\circ} \mathrm{C}, 1 \mathrm{~atm}\right) \end{aligned}$ | Given. ## 9.

$q_{\text {total }}=0$ (adiabatic) ; this is also $q_{p}$ because pressure is constant in this problem. $q=\int C d T=$ mass $\bullet$ heat capacity $\bullet\left(t_{\text {final }}-t_{\text {initial }}\right) \quad$ when heat capacity is a constant except for a phase change where need to use instead: $q=$ mass $\bullet\left(\Delta \mathbf{H}_{\text {phase change }} \mathrm{cal}^{-1}\right.$ ) $\Delta \mathbf{H}=q_{p}$, which is 0 because adiabatic.

## insulated (adiabatic)

Assume that final state is at $0^{\circ} \mathrm{C}$ with both ice and water present.

| 1 | 20 g ice, $-5^{\circ} \mathrm{C} \rightarrow 20 \mathrm{~g}$ ice, $0^{\circ} \mathrm{C}$ | $\mathrm{q}_{1}=20 \mathrm{~g}\left(0.5 \mathrm{cal} \mathrm{deg}^{-1} \mathrm{~g}^{-1}\right)(0--5)$ |
| :--- | :--- | :--- |
| 2 | 30 g water, $25^{\circ} \mathrm{C} \rightarrow 30 \mathrm{~g}$ water, $0^{\circ} \mathrm{C}$ | $\left.\mathrm{q}_{2}=30 \mathrm{~g} \mathrm{(1.0cal} \mathrm{deg}^{-1} \mathrm{~g}^{-1}\right)(0-25)$ |
| 3 | xg ice, $0^{\circ} \mathrm{C} \rightarrow \mathrm{x} \mathrm{g}$ water, $0^{\circ} \mathrm{C}$ | $\mathrm{q}_{3}=\mathrm{xg}\left(80 \mathrm{cal} \mathrm{g}^{-1}\right)$ |

$$
\mathrm{q}_{\text {total }}=0=\mathrm{q}_{1}+\mathrm{q}_{2}+\mathrm{q}_{3}
$$

$0=20 \mathrm{~g}\left(0.5 \mathrm{cal} \mathrm{deg}^{-1} \mathrm{~g}^{-1}\right)(0--5)+30 \mathrm{~g}\left(1.0 \mathrm{cal} \mathrm{deg}^{-1} \mathrm{~g}^{-1}\right)(0-25)+\mathrm{xg}\left(80 \mathrm{cal} \mathrm{g}^{-1}\right)$
$0=50-750+80 x$
Solving for x ,
$\mathrm{x}=700 / 80=8.75 \mathrm{~g}$
Final state is 11.25 g ice and 38.75 g water, all at $0^{\circ} \mathrm{C}$
If we had found a negative value for $x$ then the final state would be some of the water will have turned to ice instead. This could happen if we had either less water or lower temperature of water to begin with.

To calculate $\Delta \mathbf{S}$, we use for each step, either $\Delta \mathbf{S}=\mathrm{q}_{\text {Rev,trans }} / T_{\text {trans }}$, or else use $\Delta \mathbf{S}=\mathrm{C}_{\mathrm{p}} \ln \left(\mathrm{T}_{\text {final }} / T_{\text {initial }}\right)$ from $\mathbf{S}=\mathbf{S}(\mathrm{T}, \mathrm{p})$ and $\mathrm{dp}=0$ and $\mathrm{C}_{\mathrm{p}}$ is given independent of T in these cases.
$\Delta \mathbf{S}=\Delta \mathbf{S}_{1}+\Delta \mathbf{S}_{2}+\Delta \mathbf{S}_{3}$
$=20(0.5) \ln (273 / 268)+30(1) \ln (273 / 298)+8.75(80) / 273$
$=0.1848-2.6287+2.5641=+0.1202$ cal K $^{-1}$. We expected $\Delta \mathbf{S}>0$ for a spontaneous
process such as this one.
10. Just like problem 9, but four different amounts of water, ending in 4 different final states.
For all cases:
$\mathrm{q}_{\text {total }}=0$ (adiabatic) ; this is also $\mathrm{q}_{\mathrm{p}}$ because pressure is constant in this problem. $\mathrm{q}=\int \mathrm{C} d \mathrm{~T}=$ mass• heat capacity• $\left(\mathrm{t}_{\text {final }}-\mathrm{t}_{\text {initial }}\right)$ when heat capacity is a constant $\Delta H=q_{p}=0$
To calculate $\Delta \mathbf{S}$, we use for each step, either $\Delta \mathbf{S}=\mathrm{q}_{\text {REv, trans }} / T_{\text {trans }}$, or else use $\Delta \mathbf{S}=\mathrm{C}_{\mathrm{p}} \ln \left(\mathrm{T}_{\text {final }} / \mathrm{T}_{\text {initial }}\right)$ from $\mathbf{S}=\mathbf{S}(\mathrm{T}, \mathrm{p})$ and $\mathrm{dp}=0$ and because $\mathrm{C}_{\mathrm{p}}$ is given independent of T in this problem.
(a)
insulated (adiabatic)

| 1 | 20 g ice, $-5^{\circ} \mathrm{C} \rightarrow 20 \mathrm{~g}$ ice, $-2^{\circ} \mathrm{C}$ | $\mathrm{q}_{1}=20 \mathrm{~g}\left(0.5 \mathrm{cal} \mathrm{deg}^{-1} \mathrm{~g}^{-1}\right)(-2-5)$ |
| :--- | :--- | :--- |
| 2 | xg water, $25^{\circ} \mathrm{C} \rightarrow \mathrm{xg}$ water, $0^{\circ} \mathrm{C}$ | $\mathrm{q}_{2}=\mathrm{xg}\left(1.0 \mathrm{cal} \mathrm{deg}^{-1} \mathrm{~g}^{-1}\right)(0-25)$ |
| 3 | xg water, $0^{\circ} \mathrm{C} \rightarrow \mathrm{xg}$ ice, $0^{\circ} \mathrm{C}$ | $\mathrm{q}_{3}=\mathrm{xg}\left(-80 \mathrm{cal} \mathrm{g}^{-1}\right)$ |
| 4 | xg ice, $0^{\circ} \mathrm{C} \rightarrow \mathrm{xg}$ ice, $-2^{\circ} \mathrm{C}$ | $\mathrm{q}_{4}=\mathrm{xg}\left(0.5 \mathrm{cal} \mathrm{deg}^{-1} \mathrm{~g}^{-1}\right)(-2-0)$ |

$$
\mathrm{q}_{\text {total }}=0=\mathrm{q}_{1}+\mathrm{q}_{2}+\mathrm{q}_{3}+\mathrm{q}_{4}
$$

$0=20 \mathrm{~g}\left(0.5 \mathrm{cal} \mathrm{deg}^{-1} \mathrm{~g}^{-1}\right)(-2--5)+\mathrm{xg}\left(1.0 \mathrm{cal} \mathrm{deg}^{-1} \mathrm{~g}^{-1}\right)(0-25)+\mathrm{xg}\left(80 \mathrm{cal} \mathrm{g}^{-1}\right)$ $+x \mathrm{~g}\left(0.5 \mathrm{cal} \mathrm{deg}^{-1} \mathrm{~g}^{-1}\right)(-2-0)$
$0=30-25 x-80 x-x$
Solving for x ,
$\mathrm{x}=30 / 106=0.28 \mathrm{~g}$ of water to start with Answer
$\Delta \mathbf{S}=\Delta \mathbf{S}_{1}+\Delta \mathbf{S}_{2}+\Delta \mathbf{S}_{3}+\Delta \mathbf{S}_{4}$
$=20(0.5) \ln (271 / 268)+0.28(1) \ln (273 / 298)+0.28(-80) / 273+0.28(0.5) \ln (271 / 273)$
$=0.1113-0.0245-0.0820-0.0010=0.0038 \mathrm{cal} \mathrm{deg}^{-1}$ Answer
(b)
insulated (adiabatic)

| 1 | 20 g ice, $-5^{\circ} \mathrm{C} \rightarrow 20 \mathrm{~g}$ ice, $0^{\circ} \mathrm{C}$ | $\mathrm{q}_{1}=20 \mathrm{~g}\left(0.5 \mathrm{cal} \mathrm{deg}^{-1} \mathrm{~g}^{-1}\right)(0--5)$ |
| :--- | :--- | :--- |
| 2 | xg water, $25^{\circ} \mathrm{C} \rightarrow \mathrm{xg}$ water, $0^{\circ} \mathrm{C}$ | $\left.\mathrm{q}_{2}=\mathrm{xg} \mathrm{(1.0cal} \mathrm{deg}^{-1} \mathrm{~g}^{-1}\right)(0-25)$ |
| 3 | 0.5 xg water, $0^{\circ} \mathrm{C} \rightarrow 0.5 \mathrm{xg}$ ice, $0^{\circ} \mathrm{C}$ | $\mathrm{q}_{3}=0.5 \times \mathrm{g}\left(-80 \mathrm{cal} \mathrm{g}^{-1}\right)$ |

$\mathrm{q}_{\text {total }}=0=\mathrm{q}_{1}+\mathrm{q}_{2}+\mathrm{q}_{3}$
$0=20 \mathrm{~g}\left(0.5 \mathrm{cal} \mathrm{deg}^{-1} \mathrm{~g}^{-1}\right)(0--5)+\mathrm{xg}\left(1.0 \mathrm{cal} \mathrm{deg}^{-1} \mathrm{~g}^{-1}\right)(0-25)+0.5 \mathrm{xg}\left(-80 \mathrm{cal} \mathrm{g}^{-1}\right)$
$0=50-25 \mathrm{x}-40 \mathrm{x}$
Solving for x ,
$\mathrm{x}=50 / 65=0.77 \mathrm{~g}$ of water to start with Answer
$\Delta \mathbf{S}=\Delta \mathbf{S}_{1}+\Delta \mathbf{S}_{2}+\Delta \mathbf{S}_{3}$
$=20(0.5) \ln (273 / 268)+0.77(1) \ln (273 / 298)+0.385(-80) / 273$
$=0.1848-0.0675-0.1128=0.0045$ cal deg $^{-1}$ Answer
(c)
insulated (adiabatic)

| 1 | 20 g ice, $-5^{\circ} \mathrm{C} \rightarrow 20 \mathrm{~g}$ ice, $0^{\circ} \mathrm{C}$ | $\mathrm{q}_{1}=20 \mathrm{~g}\left(0.5 \mathrm{cal} \mathrm{deg}^{-1} \mathrm{~g}^{-1}\right)(0--5)$ |
