Chemistry 342
December 7, 1999
Final Exam (3 hours)
1 J = 1 kg m ² s ⁻² k_B = 1.38066×10 ⁻²³ J K ⁻¹ $R = N_{Avogadro}k_B$ $R = 8.31441 \text{ J mol}^{-1} \text{ K}^{-1} = 1.98718 \text{ cal mol}^{-1} \text{ K}^{-1} = 0.082057 \text{ L atm mol}^{-1} \text{ K}^{-1}$ $[p+a(n/V)^2](V-nb) = nRT$ van der Waals equation of state $(\partial S/\partial V)_T = (\partial p/\partial T)_V$
$(\partial \mathbf{S}/\partial p)_T = -(\partial V/\partial T)_p$
$(\partial \mathbf{U}/\partial V)_{T} = T(\partial p/\partial T)_{V} - p$
$(\partial H/\partial p)_T = -T(\partial V/\partial T)_p + V = \{ p + (\partial U/\partial V)_T \} (\partial V/\partial p)_T + V$
$C_p - C_V = \{ p + (\partial U/\partial V)_T \} (\partial V/\partial T)_p$
monatomic gas molar heat capacity: $C_V = (3/2)R$
The limiting Debye-Hückel eqn: $\ln \gamma_{\pm} = z_{+}z_{-}I^{1/2} \left(e^{2}/10 \epsilon k_{\rm B} T \right)^{3/2} \left\{ 2\pi \rho N_{\rm Avog} \right\}^{1/2}$
for water at 25°C as the solvent, $\ln \gamma_{\pm} = z_{\pm} z I^{1/2} (1.17223)$
In $a_A = \Delta_{fus} H/R \begin{bmatrix} -1 + 1 \\ T T^* \end{bmatrix}$ ionic strength $\equiv \frac{1}{2} \sum m_i z_i^2$
***** If insufficient information is provided, you may assume ideal behavior (and you must clearly state that you are doing so), provided that there is nothing in the problem that contradicts this assumption. Otherwise, you must assume that explicitly non-ideal systems are under consideration.
1. (a) Suppose that a piece of metal with a volume of 0.1 liter at 1 atm is compressed adiabatically by a shock wave of 10^5 atm to a volume of 0.090 liter. Calculate the ΔU and ΔH of metal. (Assume the compression occurs at a constant pressure of 10^5 atm.)
ΔU

ΔH
(b) When tungsten carbide WC was burned with excess oxygen in a bomb
calorimeter, it was found for the reaction
$WC(s) + (5/2)O_2(g) \rightarrow WO_3(s) + CO_2(g)$
that $\Delta_{rxn} U$ (300 K) = -1192 kJ mol ⁻¹ . Calculate $\Delta_{rxn} H$ at 300 K.
$\Delta oldsymbol{H}$
(c) Calculate $\Delta_{formation}$ H of tungsten carbide WC from its elements if the ΔH of
·
combustion of pure C and pure W at 300 K are, respectively, -393.5 kJ mol ⁻¹ and
-837.5 kJ mol ⁻¹ .
$\Delta_f oldsymbol{H}$

d) One mole of an ideal gas, initially at 400 K and 10 atm, is adiabatically	~
expanded against a constant pressure of 5 atm until equilibrium is re-attained. If $E_V = 18.8 \pm 0.021 T J K^{-1} mol^{-1}$, calculate ΔU , ΔH , and ΔS for the change in the	f
as.	10
U	
4	

co	When 2.00 mol of an ideal gas at 330 K and 3.50 atm is subjected to isotherma mpression, its entropy decreases by 25.0 J K^{-1} . Calculate the final pressure of
$\frac{\text{the}}{p_f}$	gas and $\Delta \mathbf{G}$ for the compression.
$ P_f $	
∆G	

3. At -5°C, the vapor pressure of ice is 0.00396 atm and that of supercooled liquid water is 0.00416 atm. The enthalpy of fusion of ice is 5.85 kJ mol⁻¹ at -5°C. **Calculate** ΔG and ΔS per mole for the transition at -5°C,

outbuild 20 and 20 per more for	
	water→ ice
$\Delta \boldsymbol{G}$	
ΔS	

4. The normal melting point of mercury is -38.87°C. At this temperature, the specific volume of the liquid is $0.07324 \text{ cm}^3 \text{ g}^{-1}$ and that of the solid is $0.07014 \text{ cm}^3 \text{ g}^{-1}$. The heat of fusion is 11.63 J g^{-1} . Assume these quantities are all independent of T and p . (a) Calculate ΔS and ΔG when 1 g liquid mercury freezes at -38.87°C.
ΔS
$\Delta \boldsymbol{G}$
(b) Calculate the melting point of mercury under a pressure of 200 atm.

(d) Given the following data:
At 298 K, the standard enthalpy of combustion of diamond is -395.3 kJ mol ⁻¹ and
that of graphite is -393.4 kJ mol ⁻¹ . The densities of diamond and graphite are 3.513 and 2.260 g cm ⁻³ respectively. The molar entropies of diamond and graphite
are 2.439 and 5.694 J K ⁻¹ mol ⁻¹ , respectively. Find $\Delta G^{\ominus}_{298 K}$ for the transition
graphite—diamond at 298 K and 1 atm.
(a) Calculate the processes at which diamond and applies around he in
(e) Calculate the pressure at which diamond and graphite would be in equilibrium at 298 K.
(e) Calculate the pressure at which diamond and graphite would be in equilibrium at 298 K.

5. The partial pressure of acetic acid above acetic acid - benzene solutions at 50°C are shown below:

$X_a(\%)$	1.60	4.39	8.35	11.38	17.14	29.79	36.96	58.34	66.04	84.35	99.35	100
p_a (torr)	3.63	7.25	11.51	14.2	18.4	24.8	28.7	36.3	40.2	50.7	54.7	54.9

What would the partial pressure have been if this solution obeyed Henry's law?
Had the solution been an ideal solution, Write an equation (with all the known constants explicitly written into it) that would describe the straight line that expresses the relation between the total vapor pressure and the molefraction of acetic acid in the liquid phase.
Would the total vapor pressure of (acetic acid+benzene) liquid solutions be greater or less (which one?) than that given by that straight line? Explain.

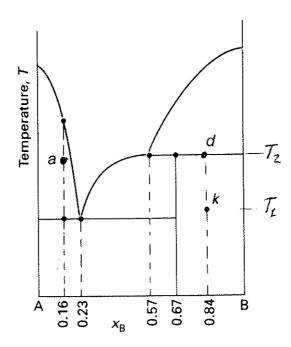

there are eutectics at 75 mol% phenol and 17°C, and 36 mol % phenol and 23°C.
A compound is formed at 50 mol% phenol with a melting point of 28°C. All these
data are at 1 atm.
(a) Sketch the phase diagram t (°C) vs. x_{phenol} at 1 atm for this system.
X _{phenol}
(b) Describe clearly what happens if a mixture containing 40 mol% phenol is cooled from 50°C to 10°C. Include a labeled cooling curve to illustrate your description.

6. Phenol melts at 40°C; α -naphthylamine melts at 50°C. In the binary system,

(c) **Describe** clearly what happens if a mixture containing 85 mol% phenol is cooled from 50°C to 10°C. Include a labeled cooling curve to illustrate your description.

(d) Given the phase diagram below which represents a solid-liquid equilibrium system, **completely describe the system** at each of the state points (a), (d), and (k) indicated, **following the format of the example**.

For example, "At t = 60°C and overall composition $X_{acetone} = 0.30$, two phases: a liquid solution of composition $X_{acetone} = 0.25$ and a gas mixture with composition $Y_{acetone} = 0.42$ "

state point (a)		,		
state point (d)	 	····		w
state point (k)				

- 7. For each of the following processes, **state which** of the quantities ΔT , ΔU , ΔH , ΔS , ΔG , q, W are equal to zero for the system specified. For those which are not zero, state whether the value is positive or negative. If information is not available to determine the sign of a non-zero value, use NA. [Hint: Only 4-5 NA] (a) A non-ideal gas is taken around an <u>irreversible</u> cycle.
- (b) At 25°C a solution is formed by mixing 0.3 mol of liquid C_6H_{14} with 0.5 mol of liquid C_7H_{16} , forming an ideal solution.
- (c) H₂ and O₂ react to form H₂O inside an insulated bomb calorimeter.
- (d) One mole of liquid benzene is vaporized at 80°C (its normal boiling point) and 1 atm in a canister fitted with a frictionless weightless piston and immersed in a heat reservoir that is maintained at 80°C.
- (e) C₂H₆ is burned with excess oxygen inside an insulated canister fitted with a frictionless weightless piston.
- (f) A reaction occurs in an electrochemical cell that has $\mathcal{E} = +0.50$ volt at constant T and p. In another experiment, \mathcal{E} of this cell is found to have a <u>negative</u> temperature coefficient. No gases are involved at either electrode of this cell.
- (g) Heat is withdrawn slowly at a uniform rate from a liquid-solid system at 1 atm at its eutectic temperature without any work being done.
- (h) A <u>non-ideal</u> gas [having negative values for both $(\partial U/\partial V)_T$ and $(\partial H/\partial p)_T$] originally at V_1 expands isothermally into an evacuated volume so as to make its final volume equal to $3V_1$.
- (i) Two ideal gases A and B each at 0.5 atm and 300 K separately occupy two glass bulbs joined by a stopcock. The stopcock is opened and all thermometer and pressure gauge readings are unchanged.
- (j) Reactants in dilute aqueous solutions are combined in a open flask immersed in a thermostatted bath, and an exothermic reaction occurs until chemical equilibrium is achieved. No gases are involved in this reaction.

Enter 0, +, -, or NA into the appropriate box in the table and provide a brief explanation on the next page

	(a)	(b)	(c)	(d)	(e)	(f)	(g)	(h)	(i)	(j)
ΔT

(h)	1						
(i)	-						
(j)							

8. In each of the following plots, given the numerical value for the area |A| in the units appropriate to the graph, write an equation defining the area, following the format of the example.

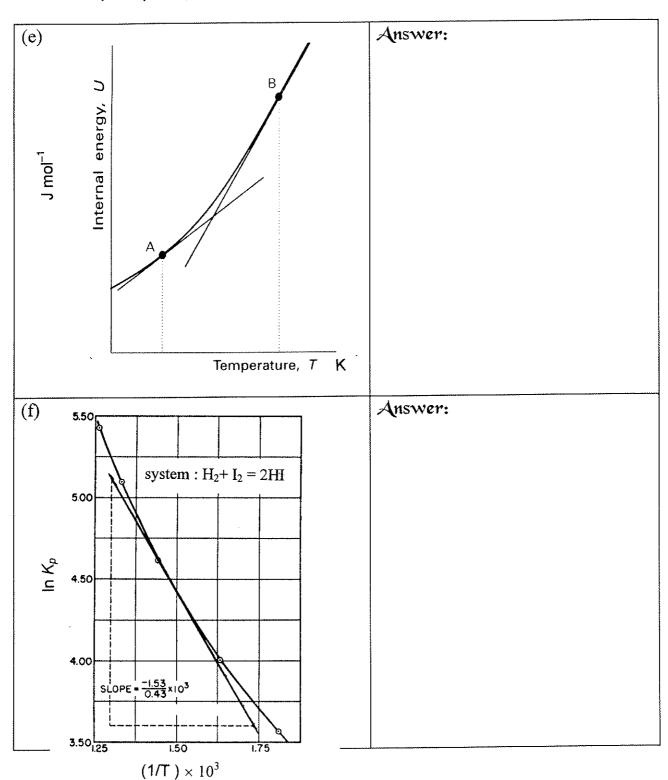

For example, " $\Delta \mathbf{G}_T = \int_{1 \text{ atm}}^{20 \text{atm}} V_m dp = A \text{ L atm mol}^{-1}$ ".

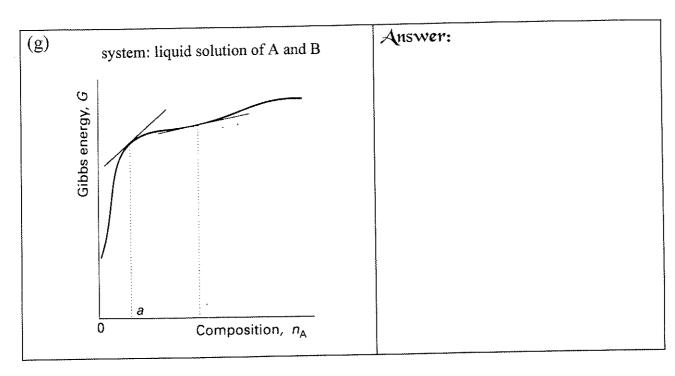

In each of the following plots, given the straight line with a value of the slope as shown in units that are appropriate to the plot, write an equation describing the straight line, following the format of the example.

For example, " $p_A = p_A^* x_A$, where the slope is $p_A^* = 33.5$ mm Hg"

In each of the following plots, given the data curve that is extrapolated to the appropriate limit to find the intercept, shown in units that are appropriate to the plot, write an equation describing the intercept, following the format of the example.

For example, " $\lim (as p \rightarrow 0) (pV_m/RT) = (pV_m/RT)_{ideal} = 1$ "
