## Chemistry 342

ANSWERS to Second Exam
March 18, 2005
2:00 PM in C6 Lecture Center
Write all work you want graded in the spaces provided. Both the logical solution to the problem and the answer to the question are required. What is required is an answer in terms of the original numerical data, including all numerical values and units of conversion factors. Use no intermediate calculated numbers, except where such numbers arise from answers to previous parts. The solution has to be worked out in the form of complete equations, with justification or basis for the use in the specific problem. Final numerical values must include the correct units.
In other words, the instructions are the same as for Exam 1.

```
POSSIBLY USEFUL INFO: \(1 \mathrm{~J}=1 \mathrm{~kg} \mathrm{~m}^{-2} \mathrm{~s}^{-2} \quad 1 \mathrm{~atm}=101325 \mathrm{~Pa}\)
    \(\left(p+\mathrm{n}^{2} \mathrm{a} / V^{2}\right)(V-\mathrm{nb})=\mathrm{nR} T\)
    \(\mathrm{R}=8.31441 \mathrm{~J} \mathrm{~mol}^{-1} \mathrm{~K}^{-1}=1.98718 \mathrm{cal} \mathrm{mol}^{-1} \mathrm{~K}^{-1}=0.082057 \mathrm{~L} \mathrm{~atm} \mathrm{~mol}{ }^{-1} \mathrm{~K}^{-1}\)
\((\partial \boldsymbol{U} / \partial V)_{T}=T(\partial p / \partial T)_{V}-p \quad(\partial \boldsymbol{H} / \partial p)_{T}=-T(\partial V / \partial T)_{p}+V \quad \mu_{\mathrm{JT}} \equiv(\partial T / \partial p)_{H} \quad(\partial \boldsymbol{H} / \partial p)_{T}=-C_{p} \mu_{\mathrm{JT}}\)
\(C_{p}-C_{V}=\left\{p+(\partial \boldsymbol{U} / \partial V)_{T}\right\}(\partial V / \partial T)_{p}\)
special case : \(\left.\left[T_{f} / T_{i}\right]^{C v / R}\right\}=\left[V_{i} / V_{f}\right]\) only for ideal gas undergoing reversible adiabatic process

1. Consider a perfect gas contained in a cylinder and separated by a frictionless adiabatic piston into two sections $\mathcal{A}$ and $\mathscr{B}$. All changes in $\mathcal{B}$ are isothermal, that is a thermostat surrounds $\mathscr{B}$ to keep its temperature constant. There is 2.00 mol of the gas in each section. Initially $T_{\mathcal{A}}=T_{\mathcal{B}}=300 \mathrm{~K}, V_{\mathcal{A}}=V_{\mathcal{B}}=2.00 \mathrm{~L}$. Heat is added to section $\mathcal{A}$ and the piston moves to the right reversibly until the final volume of section $\mathcal{B}$ is 1.00 L .
Calculate the work done by the gas in section $\mathcal{A}$. Calculate for the gas in each section: $\Delta \boldsymbol{U}$, $q, \Delta \boldsymbol{S}, \Delta \boldsymbol{A}, \Delta \boldsymbol{H}, \Delta \boldsymbol{G}$.
Calculate $\Delta \boldsymbol{S}$ of the total system and its surroundings.
Assume

$$
C_{V}=20 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}
$$

Ideal:

$$
C_{p}=28.3144 \mathrm{~J} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}
$$

final

> ${ }^{a}$ Solid-state transition with $\Delta H=368 \mathrm{cal} \mathrm{mole}^{-1}$.
> ${ }^{b}$ Solid-state transition with $\Delta H=121 \mathrm{cal} \mathrm{mole}^{-1}$.
> ${ }^{c}$ Melting point, $\Delta H=568 \mathrm{cal} \mathrm{mole}^{-1}$.
> ${ }^{d}$ Normal boiling point, $\Delta H=4463 \mathrm{cal} \mathrm{mole}^{-1}$.

Below 20 K the heat capacity obeys the law $C_{p}=\mathrm{a} T^{3}$.
Calculate the absolute entropy of hydrogen sulfide gas at 1 atm and 212.8 K .
$S($ gas, $1 \mathrm{~atm}, 212.8 \mathrm{~K})=S(0 \mathrm{~K})+\Delta S($ solid $\mathrm{I}, 0 \mathrm{~K} \rightarrow 20 \mathrm{~K})+\Delta S($ solid I, $20 \mathrm{~K} \rightarrow 103.5 \mathrm{~K})$
$+\Delta S_{\text {trans }}$ (solid I to solid II at 103.5 K$)+\Delta S$ (solid II, 103.5 K $\rightarrow 126.2 \mathrm{~K}$ )
$+\Delta S_{\text {trans }}$ (solid II to solid III, at 126.2 K) $+\Delta S$ (solid III, 126.2 K $\rightarrow 187.6 \mathrm{~K}$ )
$+\Delta \boldsymbol{S}_{\text {trans }}$ (solid III to liquid at 187.6 K ) $+\Delta \boldsymbol{S}$ (liquid, $187.6 \mathrm{~K} \rightarrow 212.8 \mathrm{~K}$ )
$+\Delta \boldsymbol{S}_{\text {trans }}$ (liquid to gas at 212.8 K ), all at 1 atm so that $\mathrm{d} p=0$ for every step and for one mole Use $\mathrm{d} \mathbf{S}=\mathrm{d} \boldsymbol{q}_{\text {rev }} / T$ or else $\mathrm{d} \mathbf{S}=\left(C_{p} / T\right) \mathrm{d} T+(\partial \mathbf{S} / \partial p)_{T} \mathrm{~d} p$ to obtain each $\Delta \boldsymbol{S}$ :
$S(0 \mathrm{~K})=0$ Third Law of thermodynamics
Debye T-cubed law: $C_{p}=$ a $T^{3}$, thus, a $20^{3}=1.25 \mathrm{cal} \mathrm{K}^{-1} \mathrm{~mol}^{-1}$
$\Delta S$ (solid $1,0 \mathrm{~K} \rightarrow 20 \mathrm{~K})=\int_{0}^{20}\left(\mathrm{a} T^{3} / T\right) \mathrm{d} T=\mathrm{a}(1 / 3)\left[\mathrm{T}^{3}\right]_{0}^{20}=(1 / 3) 1.25 \quad=0.42 \mathrm{cal} \mathrm{K}^{-1} \mathrm{~mol}^{-1}$
$\Delta S($ solid $\mathrm{I}, 20 \mathrm{~K} \rightarrow 103.5 \mathrm{~K})=\int_{20}{ }^{103.5}\left(\mathrm{C}_{p} / T\right) \mathrm{d} T$
$\approx$ sum over increments of $C_{p} / T$ over $T=20$ to 103.5 good enough approximation for this test $\approx\{1.25 / 20+2.48 / 30+3.56 / 40+4.56 / 50+5.51 / 60+6.43 / 70+7.31 / 80+8.26 / 90$

$$
\begin{aligned}
+9.36 / 100\} \times 10+ & (9.36 / 103.5) \times 3.5 \\
& \approx 7.26 \mathrm{cal} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}
\end{aligned}
$$

(Of course, we could use a graphical method of integration, or for better accuracy, fit the $C_{p}$ values to a polynomial function in $T$ and then do analytical integration.)
$\Delta \boldsymbol{S}_{\text {trans }}$ (solid I to solid II at 103.5 K ) $=\boldsymbol{q}_{\mathrm{rev}} / T=\boldsymbol{q}_{\mathrm{p}} / T=\Delta \boldsymbol{H}_{\text {trans }} / T=+368 / 103.5$

$$
=3.55 \mathrm{cal} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}
$$

$\Delta \boldsymbol{S}($ solid II, 103.5 K $\rightarrow 126.2 \mathrm{~K})=\int_{103.5}{ }^{126.2}\left(C_{p} / T\right) \mathrm{d} T$
$\approx$ sum over increments of $C_{p} / T$ over $\mathrm{T}=103.5$ to 126.2 K
$\approx 11.25 / 105 \times 1.5+11.79 / 110 \times 5+13.27 / 120 \times 10+13.27 / 126.2 \times 6.2 \approx 2.45 \mathrm{cal} \mathrm{K}^{-1} \mathrm{~mol}^{-1}$
$\Delta \boldsymbol{S}_{\text {trans }}$ (solid II to solid III, at 126.2 K ) $=\boldsymbol{q}_{\text {rev }} / T=\boldsymbol{q}_{\mathrm{p}} / T=\Delta \boldsymbol{H}_{\text {trans }} / T=+121 / 126.2$
$=0.96 \mathrm{cal} \mathrm{K}^{-1} \mathrm{~mol}^{-1}$
$\Delta \boldsymbol{S}($ solid III, 126.2 K $\rightarrow 187.6 \mathrm{~K})=\int_{126.2^{187.6}}\left(C_{p} / T\right) \mathrm{d} T$
$\approx$ sum over increments of $C_{p} / T$ over $\mathrm{T}=126.2$ to 187.6 K
$\approx 13.25 / 130 \times 4.8+13.33 / 140 \times 10+13.45 / 150 \times 10+13.92 / 170 \times 20+13.92 / 187.6 \times 17.6$

$$
\approx 5.28 \mathrm{cal} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}
$$

$\Delta \boldsymbol{S}_{\text {trans }}($ solid III to liquid at 187.6 K$)=\boldsymbol{q}_{\mathrm{rev}} / T=\boldsymbol{q}_{\mathrm{p}} / T=\Delta \boldsymbol{H}_{\text {trans }} / T=+568 / 187.6$

$$
=3.03 \mathrm{cal} \mathrm{~K}^{-1} \mathrm{~mol}^{-1}
$$

$\Delta \boldsymbol{S}$ (liquid, 187.6 K $\rightarrow 212.8 \mathrm{~K})=\int_{187.6}{ }^{212.8}\left(C_{p} / T\right) \mathrm{d} T$
$\approx$ sum over increments of $C_{p} / T$ over $\mathrm{T}=187.6$ to 212.8 K
$\approx 16.21 / 190 \times 2.4+16.31 / 210 \times 20+16.31 / 212.8 \times 2.8 \quad \approx 1.97 \mathrm{cal} \mathrm{K}^{-1} \mathrm{~mol}^{-1}$
$\Delta \boldsymbol{S}_{\text {trans }}($ liquid to gas at 212.8 K$)=\boldsymbol{q}_{\mathrm{rev}} / T=\boldsymbol{q}_{\mathrm{p}} / T=\Delta \boldsymbol{H}_{\text {trans }} / T=+4463 / 212.8$
$=20.97 \mathrm{cal} \mathrm{K}^{-1} \mathrm{~mol}^{-1}$
$\boldsymbol{S}($ gas, $1 \mathrm{~atm}, 212.8 \mathrm{~K})=0+0.42+7.26+3.55+2.45+0.96+5.28+3.03+1.97+20.97$
$=45.89 \mathrm{cal} \mathrm{K}^{-1} \mathrm{~mol}^{-1}$
3. Assume that a gas obeys the equation $p(V-b)=R T$, where $b$ is a constant, independent of $T$ and $p$. Derive an expression for the fugacity of a real gas as a function of $T$ and $p$, starting from $\mathrm{d} \boldsymbol{G}=V \mathrm{~d} p-S \mathrm{~d} T$. Apply the derived equation to this particular equation of state.

$$
\mathrm{d} \mathbf{G}=V \mathrm{~d} p-\mathbf{S} \mathrm{d} T
$$

For a particular temperature T and one mole of ideal gas,
$\mathrm{d} \mu_{\text {ideal }}=V_{\text {ideal }} \mathrm{d} p$ for an ideal gas
When integrated from $p=1$ atm to $p$ this gives
$\mu_{\text {ideal }}-\mu^{\circ}(T)=\int_{1}^{p}(\mathrm{R} T / p) \mathrm{d} p=\mathrm{R} T \ln (p / 1)$
$\mathrm{d} \mu=V \mathrm{~d} p$ for a real gas in which $V=\mathrm{R} T Z / p$
$\mathrm{d} \mu_{\text {ideal }}=V_{\text {ideal }} \mathrm{d} p$ for an ideal gas
Subtract one equation from the other,
$\mathrm{d}\left(\mu-\mu_{\text {ideal }}\right)=\left(V-V_{\text {ideal }}\right) \mathrm{d} p$
Integrate between the limits $p^{*}$ and $p:\left(\mu-\mu_{\text {ideal }}\right)=\int_{p^{*}}^{p}\left(V-V_{\text {ideal }}\right) \mathrm{d} p$
Now let $p^{*} \rightarrow 0$; in this limit as $p^{*} \rightarrow 0, \mu \rightarrow \mu_{\text {ideal }}$
Thus the equation becomes $\left(\mu-\mu_{\text {ideal }}\right)=\int_{0}^{p}\left(V-V_{\text {ideal }}\right) \mathrm{d} p$
But we have $\mu_{\text {ideal }}=\mu^{\circ}(T)+\mathrm{R} T \ln (p / 1)$ from (1)
from which we define fugacity (to have an equation that has the same form)
$\mu=\mu^{\circ}(T)+R T \ln (f / 1)$
from (2) we write $\left(\mu-\mu_{\text {ideal }}\right)=\mathrm{R} T \ln (f / 1)-\mathrm{R} T \ln (p / 1)=\int_{0}^{p}\left(V-V_{\text {ideal }}\right) \mathrm{d} p$
$\therefore \mathrm{R} T \ln (f / p)=\int_{0}^{p}\{\mathrm{R} T \mathrm{Z} / p-\mathrm{R} T / p\} \mathrm{d} p=\mathrm{R} T \int_{0}^{p}\{(\mathrm{Z}-1) / p\} \mathrm{d} p$
$\ln (f / p)=\int_{0}^{p}\{(\mathrm{Z}-1) / p\} \mathrm{d} p$ for any real gas
For the given equation of state $p(V-b)=R T: V=b+(R T / p)$
$\mathrm{R} T \ln (f / p)=\int_{0}^{p}\left(V-V_{\text {ideal }}\right) \mathrm{d} p=\int_{0}^{p}\{\mathrm{~b}+\mathrm{R} T / p-\mathrm{R} T / p\} \mathrm{d} p=\mathrm{b} \int_{0}^{p} \mathrm{~d} p=\mathrm{b} p$
In $(f / p)=b p / R T$
$f=p \exp [\mathrm{bp} / \mathrm{R} T]$
4. The $p$ versus $t^{\circ} \mathrm{C}$ phase diagram for sulfur is shown below: (Possible phases are rhombic crystalline, monoclinic crystalline, liquid, and gas, and the stable form of the element is rhombic.)

(a) On the figure given above, identify all the areas, points, and lines (curved or straight) with the correct phase descriptions (i.e., which phases are present).
(b) Where more than one phase is present, derive the Clapeyron equation that describes the constraint that links the pair of variables $p$ and $T$, ie., the equation that describes the area, line or point (where you have placed an identifying mark such as $\mathrm{A}, \mathrm{B}, \mathrm{C}, \mathrm{D}, \mathrm{E}, \ldots$ ) Use explicit symbols and define each of the symbols you use.
We start from the general $\mathrm{d} \boldsymbol{G}=V \mathrm{~d} p-\mathrm{S} \mathrm{d} T$ and write the equation for both phase $\alpha$ and phase $\beta$ :
$\mathrm{d} \boldsymbol{G}_{\alpha}=V_{\alpha} \mathrm{d} p-\mathbf{S}_{\alpha} \mathrm{d} T$
$\mathrm{d} \mathrm{G}_{\beta}=V_{\beta} \mathrm{d} p-\mathrm{S}_{\beta} \mathrm{d} T$
Impose the condition that the two phases are in equilibrium: $\mathrm{d} \boldsymbol{G}_{\alpha}=\mathrm{d} \boldsymbol{G}_{\beta}$
$V_{\alpha} \mathrm{d} p-\mathbf{S}_{\alpha} \mathrm{d} T=V_{\beta} \mathrm{d} p-\mathrm{S}_{\beta} \mathrm{d} T$
Rearrange to get:
$\left(V_{\alpha}-V_{\beta}\right) \mathrm{d} p=\left(\boldsymbol{S}_{\alpha}-\mathbf{S}_{\beta}\right) \mathrm{d} T$
$\mathrm{d} p / \mathrm{d} T=\left(\boldsymbol{S}_{\alpha}-\boldsymbol{S}_{\beta}\right) /\left(V_{\alpha}-V_{\beta}\right)$ This is the general Clapeyron equation which applies to any two phases that are in equilibrium.

Curved line A = Coexistence of rhombic and monoclinic crystalline phases:
$\mathrm{d} p / \mathrm{d} T=\left(\boldsymbol{S}_{\text {rhombic }}-\boldsymbol{S}_{\text {monoclinic }}\right) /\left(V_{\text {rhombic }}-V_{\text {monoclinic }}\right)$
Curved line $B=$ coexistence of monoclinic crystalline phase and liquid phase:
$\mathrm{d} p / \mathrm{d} T=\left(\boldsymbol{S}_{\text {liquid }}-\boldsymbol{S}_{\text {monoclinic }}\right) /\left(V_{\text {liquid }}-V_{\text {monoclinic }}\right)$
Curved line $C=$ coexistence of liquid and vapor:
$\mathrm{d} p / \mathrm{d} T=\left(\boldsymbol{S}_{\text {liquid }}-\boldsymbol{S}_{\text {vapor }}\right) /\left(V_{\text {liquid }}-V_{\text {vapor }}\right)$
Curved line $\mathrm{D}=$ coexistence of monoclinic crystals and vapor phase:
$\mathrm{d} p / \mathrm{d} T=\left(\boldsymbol{S}_{\text {monoclinic }}-\boldsymbol{S}_{\text {vapor }}\right) /\left(V_{\text {monoclinic }}-V_{\text {vapor }}\right)$
Curved line $\mathrm{E}=$ coexistence of rhombic crystals and vapor phase:
$\mathrm{d} p / \mathrm{d} T=\left(\boldsymbol{S}_{\text {rhombic }}-\boldsymbol{S}_{\text {vapor }}\right) /\left(V_{\text {rhombic }}-V_{\text {vapor }}\right)$
(c) Where more than two phases are present, provide the equations that have to be solved for a unique set of coordinates ( $T, p$ ). Again, unless already defined in part (b), define each of the symbols you use.
Point F = coexistence of rhombic crystals, monoclinic crystals and vapor:
At this special $(T, p)$, equations for curves $\mathrm{A}, \mathrm{D}$, and E all have to hold:
$\mathrm{d} p / \mathrm{d} T=\left(\boldsymbol{S}_{\text {rhombic }}-\boldsymbol{S}_{\text {monoclinic }}\right) /\left(V_{\text {rhombic }}-V_{\text {monoclinic }}\right) \quad$ curve A
$\mathrm{d} p / \mathrm{d} T=\left(\boldsymbol{S}_{\text {monoclinic }}-\boldsymbol{S}_{\text {vapor }}\right) /\left(V_{\text {monoclinic }}-V_{\text {vapor }}\right) \quad$ curve D
$\mathrm{d} p / \mathrm{d} T=\left(\boldsymbol{S}_{\text {rhombic }}-\boldsymbol{S}_{\text {vapor }}\right) /\left(V_{\text {rhombic }}-V_{\text {vapor }}\right) \quad$ curve E
Because of the quantities that appear in common in 2 equations at a time, only the intersection of any two of the three equations define the unique set ( $T, p$ ). That is, given the temperature dependence and pressure dependence of $S$ and $V$ for each of the three phases, integrate two of the three equations to get $p=\mathrm{f}(T)$ and $p=\mathrm{g}(T)$. Then solve for the value of $T_{\text {triple. }}$. Put this value of $T_{\text {triple }}$ back into $p=f(T)$ and solve for $p$. This value is $p_{\text {triple }}$ for point $F$, at which rhombic, monoclinic and vapor are in equilibrium.

Point G = coexistence of monoclinic crystals, liquid, and vapor:
At this special $(T, p)$, equations for curves $\mathrm{B}, \mathrm{C}$, and D all have to hold:
$\mathrm{d} p / \mathrm{d} T=\left(\boldsymbol{S}_{\text {liquid }}-\boldsymbol{S}_{\text {monoclinic }}\right) /\left(V_{\text {liquid }}-V_{\text {monoclinic }}\right)$
curve B
$\mathrm{d} p / \mathrm{d} T=\left(\boldsymbol{S}_{\text {liquid }}-\boldsymbol{S}_{\text {vapor }}\right) /\left(V_{\text {liquid }}-V_{\text {vapor }}\right)$
curve C
$\mathrm{d} p / \mathrm{d} T=\left(\boldsymbol{S}_{\text {monoclinic }}-\boldsymbol{S}_{\text {vapor }}\right) /\left(V_{\text {monoclinic }}-V_{\text {vapor }}\right) \quad$ curve D
Do the same as above, that is, given the temperature dependence and pressure dependence of $S$ and $V$ for each of the three phases, integrate two of the three equations to get $p=r(T)$ and $p=\mathrm{s}(T)$. Then solve for the value of $T_{\text {triple }}$. Put this value of $T_{\text {triple }}$ back into $p=\mathrm{r}(T)$ and solve for $p$. This value is $p_{\text {triple }}$ for point $G$, at which liquid, monoclinic and vapor are in equilibrium.
5. The vapor pressures over a liquid solution of acetone and chloroform are described by the graph below, where the $x$ axis reads from 0 to 1 in mole fraction of chloroform.

Find the numerical values and attach the proper units to each number:

| the vapor pressure of pure chloroform | 295 Torr |
| :--- | :--- |
| the vapor pressure of pure acetone | 350 Torr |
| the Henry's Law constant of acetone dissolved in <br> chloroform | 150 Torr |
| the Henry's Law constant of chloroform dissolved in <br> acetone | 139 Torr |
| partial pressure of acetone in the vapor over a liquid <br> solution having 40 mole per cent acetone | 102 Torr |
| total vapor pressure of a solution containing 20 <br> mole per cent acetone | 250 Torr |
| mole fraction of acetone in the vapor over a liquid <br> solution which is 20 mole per cent acetone | 0.144 (see below) |

Use this space for computations, if any are required beyond reading numbers off the graph. All numbers are read off the graph directly except for:
$\mathrm{y}_{\mathrm{a}}=\mathrm{p}_{\mathrm{a}} / \mathrm{p}_{\text {tot }}=36$ Torr/ 250 Torr $=0.144$
6. Consider the following system: Pure liquid $A$ has a vapor pressure equal to $p_{A}{ }^{*}$ at 300 K while pure liquid $B$ has a vapor pressure equal to $p_{B}{ }^{*}$ at 300 K . The molecules of type $A$ have an electric dipole moment equal to 3.2 debye and are capable of forming 1 hydrogen bond per molecule. On the other hand, $B$ molecules do not have a dipole moment at all. $B$ molecules have a greater electric polarizability than A molecules but are incapable of forming hydrogen bonds. Use only this information to answer the following. For some of the questions, quantitative results will have to wait until we have studied colligative properties. Which of the following are likely to be true (select all correct ones) about the vapor pressures, boiling temperatures, and compositions of this system?
A $\checkmark p_{A}{ }^{*}<p_{B}{ }^{*}$ at 300 K
B $p_{A}{ }^{*} \approx p_{B}{ }^{*}$ at 300 K
C $p_{A}{ }^{*}>p_{B}{ }^{*}$ at 300 K
D $T_{b, A^{*}}<T_{b, B^{*}}$ at 1 atm
E $\quad T_{b, A}{ }^{*} \approx T_{b, B}{ }^{*}$ at 1 atm
$\mathrm{F} \checkmark T_{b, A}{ }^{*}>T_{b, B}{ }^{*}$ at 1 atm
For a $50-50 \mathrm{~mol} \%$ solution of $A$ and $B$ :
G $p_{\text {total }}<1 / 2\left(p_{A}{ }^{*}+p_{B}{ }^{*}\right)$ at 300 K
H $p_{\text {total }}=1 / 2\left(p_{A}{ }^{*}+p_{B}{ }^{*}\right)$ at 300 K
I $\checkmark p_{\text {total }}>1 / 2\left(p_{A}{ }^{*}+p_{B}{ }^{*}\right)$ at 300 K
$\mathrm{J} \checkmark p_{A}<p_{A}{ }^{*}$ at 300 K
$\mathrm{K} \checkmark p_{A}>1 / 2 p_{A}{ }^{*}$ at 300 K
L $\checkmark$ the vapor pressure of A exceeds that given by Raoult's law
M the vapor pressure is depressed compared to that predicted by Raoult's law
$\mathrm{N} T_{b}>T_{b, B^{*}}$ at 1 atm
O $T_{b}>T_{b, A^{*}}$ at 1 atm
$\mathrm{P} \checkmark T_{b}<1 / 2\left(T_{b, A}{ }^{*}+T_{b, B}{ }^{*}\right)$ at 1 atm
$\mathrm{Q} \quad T_{b}=1 / 2\left(T_{b, A^{*}}+T_{b, B^{*}}\right)$ at 1 atm
$\mathrm{R} \quad T_{b}>1 / 2\left(T_{b, A^{*}}+T_{b, B^{*}}\right)$ at 1 atm
S $\checkmark$ mole fraction of A in the vapor $<1 / 2$
T mole fraction of A in the vapor $=1 / 2$
$U$ mole fraction of $A$ in the vapor $>1 / 2$
$V$ mole fraction of $A$ in the vapor $<p_{A} /\left(p_{A}+p_{B}\right)$
$\mathrm{W} \checkmark$ mole fraction of A in the vapor $=p_{A} /\left(p_{A}+p_{B}\right)$
X mole fraction of A in the vapor $>p_{A} /\left(p_{A}+p_{B}\right)$
Y mole fraction of $A$ in the vapor $<p_{A}{ }^{*} /\left(p_{A}{ }^{*}+p_{B}{ }^{*}\right)$
Z mole fraction of A in the vapor $=p_{A}{ }^{*} /\left(p_{A}{ }^{*}+p_{B}{ }^{*}\right)$
$\Sigma \checkmark$ mole fraction of A in the vapor $>p_{A}{ }^{*} /\left(p_{A}{ }^{*}+p_{B}{ }^{*}\right)$
$\Phi$ fractional distillation leads to pure A in the pot and pure B coming off the distillation column
$\Delta$ fractional distillation leads to pure B in the pot and pure A coming off the distillation column
$\Omega$ fractional distillation leaves a constant-boiling mixture of A and B in the pot
Circle the letters corresponding to all the correct answers in the boxes below:

| $\mathbf{( A )}$ | B | C | D | E | $\mathbf{( F )}$ | G | H | (I) | (J) | (K) | (L) | M | N | O |
| :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- | :--- |
| $\mathbf{( P )}$ | Q | R | $\mathbf{( S )}$ | T | U | V | (W) | X | Y | Z | $(\mathrm{\Sigma})$ | $\Phi$ | $\Delta$ | $\Omega$ |

7. The variation with temperature of $\mathrm{K}_{\mathrm{p}}$ for the gas-phase equilibrium

$$
\mathrm{PCl}_{5}(\mathrm{~g})=\mathrm{PCl}_{3}(\mathrm{~g})+\mathrm{Cl}_{2}(\mathrm{~g})
$$

has been measured and is shown below, in table and graphical form. Reading the plot carefully, we see that $\mathrm{K}_{\mathrm{p}}=10$ at $1 / \mathrm{T}=1.73 \times 10^{-3} \mathrm{~K}^{-1}$ and $\mathrm{K}_{\mathrm{p}}=0.1$ for $1 / \mathrm{T}=2.15 \times 10^{-3} \mathrm{~K}^{-1}$.

The $\mathrm{PCl}_{5}=\mathrm{PCl}_{3}+\mathrm{Cl}_{2}$ Equilibrium

| $T\left({ }^{\circ} \mathrm{K}\right)$ | $\alpha$ | $K_{P}(\mathrm{~atm})$ |
| :--- | :---: | :---: |
| 439 | 0.124 | 0.0269 |
| 443 | 0.196 | 0.0329 |
| 462 | 0.244 | 0.0633 |
| 485 | 0.431 | 0.245 |
| 534 | 0.745 | 1.99 |
| 556 | 0.857 | 4.96 |
| 574 | 0.916 | 9.35 |
| 613 | 0.975 | 40.4 |

(a) Derive an equation that will provide a determination of the $\Delta \boldsymbol{H}_{\mathrm{rxn}}{ }^{\circ}$ for this chemical reaction in the temperature range shown.
[HINT: Start with the definition of $\boldsymbol{G}$. Also take a hint from the plot that $(1 / T)$ is a convenient explicit factor to include in your derivation. Assume that each gas behaves ideally, so that $\mathrm{K}_{\mathrm{p}}$ can be written in pressures rather than in fugacities. Later in the course, we will consider 'true' equilibrium constants in terms of fugacities.]
Derivation here:
Consider $\boldsymbol{G} / T: \partial(\boldsymbol{G} / T) / \partial T=-\boldsymbol{G} / T^{2}+(1 / T)(\partial \boldsymbol{G} / \partial T)_{p}$
Substitute $\boldsymbol{G} \equiv \boldsymbol{H}-T \mathbf{S}$ into the right side of above eqn. to get
$\partial(\boldsymbol{G} / T) / \partial T=-(\boldsymbol{H}-T \boldsymbol{S}) / T^{2}+(1 / T)(\partial \boldsymbol{G} / \partial T)_{p}$
But, from dG $=V \mathrm{~d} p-\mathbf{S d} T$ we see that $-\mathbf{S}$ can be identified as $(\partial \mathbf{G} / \partial T)_{p}$
$\partial(\boldsymbol{G} / T) / \partial T=-(\boldsymbol{H}-T \boldsymbol{S}) / T^{2}-\boldsymbol{S}(1 / T)$
$\partial(\boldsymbol{G} / T) / \partial T=-\boldsymbol{H} / T^{2} \quad$ This is the Gibbs-Helmholtz eqn.
For reactants : $\partial\left(\boldsymbol{G}_{\text {reactants }} / T\right) / \partial T=-\boldsymbol{H}_{\text {reactants }} / T^{2}$
For products : $\partial(\boldsymbol{G}$ products $/ T) / \partial T=-\boldsymbol{H}_{\text {products }} / T^{2}$
From which: $\partial\left(\Delta \boldsymbol{G}_{\mathrm{rxn}} / T\right) / \partial T=-\Delta \boldsymbol{H}_{\mathrm{rxn}} / T^{2}$
which can also be written as $\left(\partial\left(\Delta \boldsymbol{G}_{\mathrm{rxn}} / T\right) / \partial(1 / T)\right)_{p}=+\Delta \boldsymbol{H}_{\mathrm{rxn}}$
With reactants and products in their standard states, $\left(\partial\left(\Delta \boldsymbol{G}_{\mathrm{rxn}}{ }^{\circ} / T\right) / \partial(1 / T)\right)_{p}=\Delta \boldsymbol{H}_{\mathrm{rxn}}{ }^{\circ}$
Now we need to find where $\mathrm{K}_{p}$ fits into this.
At a given temperature, by integrating $\mathrm{d} \boldsymbol{G}=V \mathrm{~d} p$, for an ideal gas,
$\boldsymbol{G}_{\mathrm{C}}\left(p_{\mathrm{C}}\right)=\boldsymbol{G}_{\mathrm{C}}(1 \mathrm{~atm})+\mathrm{R} T \ln \left(p_{\mathrm{C}} / 1\right)$
For a reaction $\mathrm{aA}+\mathrm{bB}=\mathrm{cC}+\mathrm{dD}$ in the gas phase, at equilibrium, the value of $p_{\mathrm{C}}$ is the equilibrium partial pressure of $C$ in the reaction vessel, and similarly for the others.
For a reaction $\mathrm{aA}+\mathrm{bB}=\mathrm{cC}+\mathrm{dD}$ in the gas phase, at equilibrium $\boldsymbol{G}_{\text {products }}=\boldsymbol{G}_{\text {reactants }}$ Thus, we can write
$\mathrm{c} \boldsymbol{G}_{\mathrm{C}}+\mathrm{d} \boldsymbol{G}_{\mathrm{D}}=\mathrm{c}\left\{\boldsymbol{G}_{\mathrm{C}}(1 \mathrm{~atm})+\mathrm{R} T \ln \left(p_{\mathrm{C}} / 1\right)\right\}+\mathrm{d}\left\{\boldsymbol{G}_{\mathrm{D}}(1 \mathrm{~atm})+\mathrm{RT} \ln \left(p_{\mathrm{D}} / 1\right)\right\}$ $=\mathrm{a} \boldsymbol{G}_{\mathrm{A}}+\mathrm{b} \boldsymbol{G}_{\mathrm{B}}=\mathrm{a}\left\{\boldsymbol{G}_{\mathrm{A}}(1 \mathrm{~atm})+\mathrm{R} T \ln \left(p_{\mathrm{A}} / 1\right)\right\}+\mathrm{b}\left\{\boldsymbol{G}_{\mathrm{B}}(1 \mathrm{~atm})+\mathrm{RT} \ln \left(p_{\mathrm{B}} / 1\right)\right\}$
Collecting all the $\boldsymbol{G}_{\text {reactant or product }}$ ( 1 atm ) terms together, and all the In terms together, we get $\mathrm{c} \boldsymbol{G}_{C^{\circ}}+\mathrm{d} \boldsymbol{G}_{D}{ }^{\circ}-\left\{\mathrm{a} \boldsymbol{G}_{A}{ }^{\circ}+\mathrm{b} \boldsymbol{G}_{\mathrm{B}}{ }^{\circ}\right\}=-\mathrm{R} T \ln \left[\left(p_{C}{ }^{\mathrm{c}} \cdot{p_{D}}^{\mathrm{d}}\right) / p_{\mathrm{A}}{ }^{\mathrm{a}} \cdot{p_{B}}^{\mathrm{b}}\right]$
$\Delta \boldsymbol{G}_{\mathrm{rxn}}{ }^{\circ}=-\mathrm{R} T \ln \mathrm{~K}_{p}$
$\Delta \boldsymbol{G}_{\mathrm{rxn}}{ }^{\circ} / T=-\mathrm{R} \ln \mathrm{K}_{p}$
Since we see above that $\left(\partial\left(\Delta \boldsymbol{G}_{\mathrm{rxn}}{ }^{\circ} / T\right) / \partial(1 / T)\right)_{p}=\Delta \boldsymbol{H}_{\mathrm{rxn}}{ }^{\circ}$, a plot of $\mathrm{In} \mathrm{K}_{p}$ versus $1 / \mathrm{T}$ should have a slope equal to $-\Delta \boldsymbol{H}_{\mathrm{rxn}}{ }^{\circ} / \mathrm{R}$
(b) Apply your equation to the data to find the numerical value of $\Delta \boldsymbol{H}_{\mathrm{rxn}}{ }^{\circ}$. Here, ${ }^{\circ}$ means the standard state, 1 atm , of course.
Calculations here:
From the given: " $\mathrm{K}_{\mathrm{p}}=10$ at $1 / \mathrm{T}=1.73 \times 10^{-3} \mathrm{~K}^{-1}$ and $\mathrm{K}_{\mathrm{p}}=0.1$ for $1 / \mathrm{T}=2.15 \times 10^{-3} \mathrm{~K}^{-1}$ " we have the slope
$[\ln (10)-\ln (0.1)] /\left[1.73 \times 10^{-3} \mathrm{~K}^{-1}-2.15 \times 10^{-3}\right]=-4.605 / 0.42 \times 10^{-3}=-10964$
This is equal to $-\Delta \boldsymbol{H}_{\mathrm{rxn}}{ }^{\circ} / \mathrm{R}$.
Thus, $\Delta \boldsymbol{H}_{\mathrm{rxn}}{ }^{\circ}=+10964 \bullet 1.987=21,786 \mathrm{cal}$, call it $21,800 \mathrm{cal}$
Note: The graph was given only to provide a visual hint towards deriving the correct relation. You need not read any values from it.
8. Consider the following systems. In each case calculate the pressure which must be applied to $\mathscr{B}$ in order that equilibrium be established between $\mathcal{A}$ and $\mathscr{B}$ at the given temperature.

| $\mathcal{A}$ | $\mathscr{B}$ | Calculations for $p$, atm |
| :---: | :---: | :---: |
| (a) |  |  |
| rhombic sulfur density $\begin{aligned} & 1.5 \times 10^{3} \mathrm{~g} \mathrm{~L}^{-1} \\ & \Delta \boldsymbol{G}^{\circ}{ }_{\mathrm{f}}=0 \end{aligned}$ | monoclinic sulfur density $\begin{aligned} & 1.2 \times 10^{3} \mathrm{~g} \mathrm{~L}^{-1} \\ & \Delta \boldsymbol{G}_{\mathrm{f}}^{\circ}=0.023 \\ & \mathrm{kcal} \mathrm{~mol} \end{aligned}$ | For all of (a)-(c) the following apply: $\mathrm{d} \boldsymbol{G}=V \mathrm{~d} p-\mathbf{S d} T ; \mathrm{d} T=0 ; \quad$ and $\mu($ side $\mathcal{A})=\mu($ side $\mathcal{B})$ in particular, $\mu(\mathrm{rh}, p \mathrm{~atm})=\mu(\mathrm{mo}, p \mathrm{~atm})$, $\mu(\mathrm{rh}, 1 \mathrm{~atm})+\int_{\text {latm }}^{p} V_{r h} d p=\mu(\mathrm{mo}, 1 \mathrm{~atm})+\int_{\text {latm }}^{p} V_{m o} d p$ |
| $p \mathrm{~atm}$ | $p \mathrm{~atm}$ | $0+\int_{\text {latm }}^{p} \frac{32}{1.5 \times 10^{3}} d p \quad=\quad 0.023+\int_{\text {latm }}^{p} \frac{32}{1.2 \times 10^{3}} d p$ |
| $\begin{aligned} & \mathrm{V}=\frac{32 \mathrm{~g} \mathrm{~mol}^{-1}}{1.5 \times 10^{3} \mathrm{~g} \mathrm{~L}^{-1}} \\ & \mathrm{Lmol}^{-1} \end{aligned}$ | $V=\frac{32 \mathrm{~g} \mathrm{~mol}^{-1}}{1.2 \times 10^{3} \mathrm{~g} \mathrm{~L}^{-1}}$ <br> $\mathrm{L} \mathrm{mol}^{-1}$ | $0.023 \times 10^{3}=\left(\frac{32}{1.5 \times 10^{3}}-\frac{32}{1.2 \times 10^{3}}\right)(p-1) \frac{1.987}{0.08205}$ <br> Solve for $p=$ atm |

(b) This Pd membrane allows only $\mathrm{H}_{2}$ to pass

| $\downarrow$ |  |
| :--- | :--- |
| $\mathrm{H}_{2}(\mathrm{~g})$ | $\mathrm{N}_{2}(\mathrm{~g})+\mathrm{H}_{2}(\mathrm{~g})$ <br> $4 \mathrm{~N}_{2}: 1 \mathrm{H}_{2}$ mixture <br> 1 atm |
| atm |  |

$\mu_{\mathrm{H} 2}($ side $\mathcal{A})=\mu_{\mathrm{H} 2}($ side $\mathcal{B})$ since $\mathrm{H}_{2}$ can pass through $\mu_{\mathrm{H} 2}(1 \mathrm{~atm})=\mu_{\mathrm{H}_{2}}(1 \mathrm{~atm})+\mathrm{RT} \ln \left(p_{\mathrm{H} 2} / 1 \mathrm{~atm}\right)$
$p_{\mathrm{H} 2}=0.20 \bullet p$ atm (Dalton's law of partial pressures)
$0=\mathrm{RT} \ln \left(p_{\mathrm{H} 2} / 1 \mathrm{~atm}\right) \quad$ or $\quad \ln (0.20 \bullet p / 1 \mathrm{~atm})=0$
$0.20 \bullet p / 1 \mathrm{~atm}=1 \quad \therefore p=5 \mathrm{~atm}$
(c) This semi-permeable membrane allows only $\mathrm{H}_{2} \mathrm{O}$ to pass

| pure liquid $\mathrm{H}_{2} \mathrm{O}$ 1 atm <br> vapor pressure <br> $p_{\mathrm{w}}{ }^{*}$ <br> $\mathrm{V}_{\mathrm{w}}=0.018 \mathrm{Lmol}^{-1}$ | 0.1 mole percent solution of sucrose in $\mathrm{H}_{2} \mathrm{O}$ vapor pressure according to Raoult's law <br> $p$ atm <br> Raoult's law: $\begin{aligned} & p_{\mathrm{w}}=x_{\mathrm{w}} p_{\mathrm{w}}{ }^{*} \\ &=(1-0.001) p_{\mathrm{w}}{ }^{*} \\ & \mathrm{~V}_{\text {soln }} \approx 0.018 \\ & \mathrm{Lmol}^{-1} \end{aligned}$ |
| :---: | :---: |

$\mu_{\mathrm{H} 2 \mathrm{O}}($ side $\mathcal{A})=\mu_{\mathrm{H} 2 \mathrm{O}}($ side $\mathcal{B})$ since $\mathrm{H}_{2} \mathrm{O}$ can pass through $\mu_{\mathrm{H} 2 \mathrm{O}}\left(\right.$ pure liquid $\left.\mathrm{H}_{2} \mathrm{O}, 1 \mathrm{~atm}\right)=\mu_{\mathrm{H} 2 \mathrm{O}}\left(\mathrm{H}_{2} \mathrm{O}\right.$ in solution, $\left.p \mathrm{~atm}\right)$
Think of pure liquid $\mathrm{H}_{2} \mathrm{O}$ in equilibrium with its vapor: $\mu_{\mathrm{H} 2 \mathrm{O}}$ (in liquid $\left.\mathrm{H}_{2} \mathrm{O}, 1 \mathrm{~atm}\right)=\mu_{\mathrm{H} 2 \mathrm{O}}$ (in $\mathrm{H}_{2} \mathrm{O}$ vapor)
$=\mu_{\left.\mathrm{H} 2 \mathrm{O} \text { (in } \mathrm{H}_{2} \mathrm{O} \text { vapor, } 1 \mathrm{~atm}\right)+\mathrm{R} T \ln \left(p_{\mathrm{w}}{ }^{*} / 1\right) ~}^{\text {) }}$
Think of liquid solution in equilibrium with its vapor: $\mu_{\mathrm{H} 2 \mathrm{O}}$ (in liquid soln, $p_{\mathrm{w}}$ ) $=\mu_{\mathrm{H} 2 \mathrm{O}}$ (in $\mathrm{H}_{2} \mathrm{O}$ vapor over the soln)

$$
\left.=\mu_{\mathrm{H} 2 \mathrm{O}(\text { in }} \mathrm{H}_{2} \mathrm{O} \text { vapor, 1atm }\right)+\mathrm{R} T \ln \left(p_{\mathrm{w}} / 1\right)
$$

$=\mu_{\left.\mathrm{H} 2 \mathrm{O} \text { (in } \mathrm{H}_{2} \mathrm{O} \text { vapor, } 1 \mathrm{~atm}\right)+\mathrm{RT} \ln \left(0.999 p_{\mathrm{w}}{ }^{*} / 1\right) ~}^{\text {) }}$
However, here side $\mathcal{B}$ is not under its vapor pressure $p_{\mathrm{w}}{ }^{*}$, but a pressure equal to $p$ atm therefore we need to add $\int_{\text {latm }}^{p} V_{w} d p$ : Thus, $\quad \mu_{\mathrm{H} 2 \mathrm{O}}$ (in liquid soln, $p$ ) $=$ $\mu_{\mathrm{H} 2 \mathrm{O}\left(\text { in } \mathrm{H}_{2} \mathrm{O}\right.}$ vapor, 1 atm$)+\mathrm{R} T \ln \left(0.999 p_{\mathrm{w}}{ }^{*} / 1\right)+\int_{\text {latm }}^{p} V_{\text {sol }} d p$
$\therefore \mathrm{R} T \ln \left(p_{\mathrm{w}}{ }^{*} / 1\right)=\mathrm{R} T \ln \left(0.999 p_{\mathrm{w}}{ }^{*} / 1\right)+\int_{\text {latm }}^{p} V_{\text {sol }} d p$
$0.08205 T \ln (0.999)=0.018(p-1)$
Given $T$, solve for $p$
